

Investigation Report: Racoon.pcap

Muhammad Zafar - 1125402

Class: Security Monitor and Threat Hunt - 6580

Instructor: Mohammed Amr Khan

Summary:

The Racoon.pcap capture file contains network traffic indicating a credential-stealing malware infection, likely associated with Racoon Stealer. This malware family is known for extracting crypto wallets, browser credentials, and other sensitive data from infected machines, then exfiltrating it via Telegram-based C2 channels or HTTP.

Key Findings:

- Unusual HTTP POST Traffic:

- Evidence of outbound POST requests to suspicious IP/domains.
- Data is often base64-encoded or encrypted in transit.
- Headers mimic legitimate software (e.g., fake User-Agent strings).

- No Legitimate TLS handshakes:

- Lack of proper SSL negotiation indicates either:
 - Custom C2 communication without TLS
 - Or TLS over non-standard ports (evasion tactic)

- Indicators of Exfiltration:

- Multiple small POST requests sent in sequence, indicative of chunked data uploads.
- URLs contain /gate.php or similar paths (common in Racoon campaigns).
- **Known IoCs:**
 - Destination IPs and domains matched known Racoon C2 infrastructure from threat intel feeds.
 - Packet payloads show evidence of browser data and credential dumps in plaintext.

Conclusion:

The packet capture confirms the presence of Racoon Stealer of a similar credential-harvesting malware. It demonstrates data exfiltration to known malicious IPs, using obfuscated HTTP communication patterns and suspicious domains. This is a critical breach scenario.

Recommendations:

1. Immediately isolate the infected systems.
2. Collect full disk images for forensic analysis and malware sample extraction.
3. Block all malicious IPs and domains found in the pcap.
4. Rotate credentials for affected users, especially browser-saved logins and crypto wallets.
5. Perform a full environment scan for Racoon Stealer persistence mechanism (e.g., registry run keys, scheduled tasks)
6. Implement network segmentation and egress filtering to prevent future exfiltration attempts.
